

Sample Medical Document for RAG Testing

This document is for testing a Retrieval-Augmented Generation (RAG) system in a medical domain.

Diabetes Mellitus: Diabetes is a chronic condition that affects how the body processes blood sugar (glucose). Common symptoms include increased thirst, frequent urination, fatigue, and blurred vision. Type 2 diabetes is the most common form and is often linked to lifestyle factors such as obesity and lack of exercise.

Hypertension: Hypertension, also known as high blood pressure, is a condition where the force of blood against artery walls is too high. It increases the risk of heart disease, stroke, and kidney problems. Lifestyle changes such as reducing salt intake, regular exercise, and stress management can help control it.

Fever: Fever is a temporary increase in body temperature, often due to infection. It is usually a sign that the body is fighting an illness. Common causes include viral or bacterial infections.
